Automated Material Handling Systems

Dresden

Permanent

Full-time

Software-developer

Automated material handling systems are our passion. We generate the digital twin for all types of automated transport systems, whether rail-guided or free-moving, on the ceiling or on the floor. Our software offers a continuous workflow from planning to the daily operation of an AMHS with live visualization, analysis, adaptation and simulation. With this we help manufacturing high-tech companies to make their production more efficient and robust.

Develop the future

We work agile in small teams and topic oriented. We cover a big bandwidth with our stack (Java, Angular, C #, …) as well as with our tasks (backend, frontend, simulation, …).

The development goals of the next week are coordinated in weekly meetings. Your input is expressly desired.

We actively accompany your induction - if necessary - and we also support your development afterwards. It is even expressly desired. For this reason, you can easily change your area of responsibility.

What does your workplace look like?

Our office is in a central location. There you will find a modern and ergonomically designed workplace that you can adapt to your needs. So you can choose your hardware yourself and also get a monthly budget at your

disposal. Free drinks and snacks are just as natural as regular coaching and health measures.

It is important to us that you feel good! That's why you get 30 days of vacation, a subsidy for the daycare fees and the company pension scheme.

If you are traveling a lot, we will provide you with a business cell phone and promote your mobility with a job ticket, company bike or company car – according to your needs and wishes.

We probably don't need to mention that you can freely organize your working hours and take home office ☺.

What should you bring with you?

We don't really care about your degree – even if you don't have one. Your skills count with us. This should include advanced experience in a modern programming language (preferably Java, TS or C #), experience in software design, as well as a basic technical understanding. English is mandatory in our field of activity and you should at least be able to speak and write fluently.

We do not maintain hierarchies. An independent and responsible way of working is therefore essential so that you can fully develop your potential with us.
